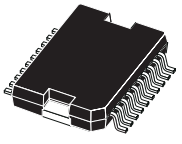
LNBP20 / LNBP1X series

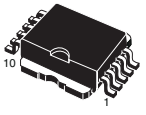
LNBP supply and control voltage regulator (parallel interface)

Feature summary

- Complete interface for two LNBs remote supply and control
- LNB selection and stand-by function
- Built-in tone oscillator factory trimmed at 22KHz
- Fast oscillator start-up facilitates DiSEqC™ encoding
- Two supply inputs for lowest dissipation
- Bypass function for slave operation
- LNB short circuit protection and diagnostic
- Auxiliary modulation input extends flexibility
- Cable length compensation
- Internal over temperature protection
- Backward current protection



PowerSO-20



PowerSO-10

Description

Intended for analog and digital satellite receivers, the LNBP is a monolithic linear voltage regulator, assembled in PowerSO-20 and PowerSO-10, specifically designed to provide the powering voltages and the interfacing signals to the LNB downconverter situated in the antenna via the coaxial cable. Since most satellite receivers have two antenna ports, the output voltage of the regulator is available at one of two logic-selectable output pins (LNBA, LNBB). When the IC is powered and put in Stand-by (EN pin LOW), both regulator outputs are disabled to allow the antenna downconverters to be supplied/controlled by others satellite receivers sharing the same coaxial lines. In this occurrence the device will limit at 3 mA (max) the backward current that could flow from LNBA and LNBB output pins to GND. (See continuous description).

1 Description (continued)

For slave operation in single dish, dual receiver systems, the bypass function is implemented by an electronic switch between the Master Input pin (MI) and the LNBA pin, thus leaving all LNB powering and control functions to the Master Receiver. This electronic switch is closed when the device is powered and EN pin is LOW.

The regulator outputs can be logic controlled to be 13 or 18 V (typ.) by mean of the VSEL pin for remote controlling of LNBs. Additionally, it is possible to increment by 1V (typ.) the selected voltage value to compensate the excess voltage drop along the coaxial cable (LLC pin HIGH).

In order to reduce the power dissipation of the device when the lowest output voltage is selected, the regulator has two Supply Input pins V_{CC1} and V_{CC2}. They must be powered respectively at 16V (min) and 23V (min), and an internal switch automatically will select the suitable supply pin according to the selected output voltage. If adequate heatsink is provided and higher power losses are acceptable, both supply pins can be powered by the same 23V source without affecting any other circuit performance.

The ENT (Tone Enable) pin activates the internal oscillator so that the DC output is modulated by a ±0.3 V, 22KHz (typ.) square wave. This internal oscillator is factory trimmed within a tolerance of ±2KHz, thus no further adjustments neither external components are required.

A burst coding of the 22KHz tone can be accomplished thanks to the fast response of the ENT input and the prompt oscillator start-up. This helps designers who want to implement the DiSEqC™ protocols [(a)].

In order to improve design flexibility and to allow implementation of newcoming LNB remote control standards, an analogic modulation input pin is available (EXTM). An appropriate DC blocking capacitor must be used to couple the modulating signal source to the EXTM pin. When external modulation is not used, the relevant pin can be left open.

Two pins are dedicated to the overcurrent protection/monitoring: CEXT and OLF. The overcurrent protection circuit works dynamically: as soon as an overload is detected in either LNB output, the output is shut-down for a time t_{off} determined by the capacitor connected between CEXT and GND. Simultaneously the OLF pin, that is an open collector diagnostic output flag, from HIGH IMPEDANCE state goes LOW.

After the time has elapsed, the output is resumed for a time $t_{on}=1/15t_{off}$ (typ.) and OLF goes in HIGH IMPEDANCE. If the overload is still present, the protection circuit will cycle again through t_{off} and ton until the overload is removed. Typical $t_{on}+t_{off}$ value is 1200ms when a 4.7µF external capacitor is used.

This dynamic operation can greatly reduce the power dissipation in short circuit condition, still ensuring excellent power-on start up even with highly capacitive loads on LNB outputs.

The device is packaged in PowerSO-20 for surface mounting. When a limited functionality in a smaller package matches design needs, a range of cost-effective PowerSO-10 solutions is also offered. All versions have built-in thermal protection against overheating damage.

a. External components are needed to comply to level 2.x and above (bidirectional) DiSEqC™ bus hardware requirements. DiSEqC™ is a trademark or EUTELSAT.

Table 1. Pin Description

SYMBOL	NAME	FUNCTION	PIN NUMBER vs SALES TYPE (LNBP)							
			20PD	10SP	11SP	12SP	13SP	14SP	15SP	16SP
V_{CC1}	Supply input 1	15V to 25V supply. It is automatically selected when V_{OUT}= 13 or 14V	2	1	1	1		1	1	1
V_{CC2}	Supply input 2	22V to 25V supply. It is automatically selected when V_{OUT}= 18 or 19V	3	2	2	2	2	2	2	2
LNBA	Output port	See truth table voltage and port selection. In stand-by mode this port is powered by the MI pin via the internal bypass switch	4	3	3	3	3	3	3	3
V_{SEL}	Output voltage selection:13 or 18V (typ)	Logic control input: see truth table	5	4	4	4	4	4	4	4
EN	Port enable	Logic control input: see truth table	6	5	5	5	5	5	5	5
OSEL	Port selection	Logic control input: see truth table	7	9	NA	NA	NA	NA	NA	NA
GND	Ground	Circuit ground. It is internally connected to the die frame	1 10 11 20	6	6	6	6	6	6	6

Table 1. Pin Description

SYMBOL	NAME	FUNCTION	PIN NUMBER vs SALES TYPE (LNBP)							
			20PD	10SP	11SP	12SP	13SP	14SP	15SP	16SP
ENT	22KHz tone enable	Logic control input: see truth table	13	7	7	7	7	7	7	7
CEXT	External capacitor	Timing capacitor used by the dynamic overload protection. Typical application is 4.7µF for a 1200ms cycle	14	8	8	8	8	8	8	8
EXTM	External modulator	External modulation input. Needs DC decoupling to the AC source. if not used, can be left open.	15	NA	NA	NA	9	NA	9	9
LLC	Line length compens. (1V typ)	Logic control input: see truth table	16	NA	NA	9	NA	9	NA	10
OLF	Over load flag	Logic output (open collector). Normally in HIGH IMPEDANCE, goes LOW when current or thermal overload occurs	17	NA	9	NA	NA	10	10	NA
MI	Master input	In stand-by mode, the voltage on MI is routed to LNBA pin. Can be left open if bypass function is not needed	18	NA	10	10	10	NA	NA	NA
LNBB	Output port	See truth tables for voltage and port selection	19	10	NA	NA	NA	NA	NA	NA

Note: The limited pin availability of the PowerSO-10 package leads to drop some functions.

3 Maximum ratings

Table 2. Absolute maximum ratings

Symbol	Parameter	Value	Unit
V_I	DC Input voltage (V_{CC1}, V_{CC2}, MI)	28	V
V_O	Output voltage	-0.3 to 28	V
I_O	Output current (LNBA, LNBB)	Internally Limited	mA
V_I	Logic input voltage (ENT, EN OSEL, VSEL, LLC)	-0.5 to 7	V
I_{SW}	Bypass switch current	900	mA
P_D	Power dissipation at T_{case} < 85°C	14	W
T_{stg}	Storage temperature range	-40 to +150	°C
T_{op}	Operating junction temperature range	-40 to +125	°C

Note: Absolute Maximum Ratings are those values beyond which damage to the device may occur. Functional operation under these condition is not implied

8 Package mechanical data

In order to meet environmental requirements, ST offers these devices in ECOPACK® packages. These packages have a Lead-free second level interconnect. The category of second Level Interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an ST trademark. ECOPACK specifications are available at: www.st.com.
