

## DUAL FULL-BRIDGE PWM MOTOR DRIVER

Dwg. PP-051

### ABSOLUTE MAXIMUM RATINGS

at  $T_J \leq +150^\circ\text{C}$

Motor Supply Voltage, $V_{BB}$ .....	45 V
Output Current, $I_{OUT}$ ( $t_w \leq 20 \mu\text{s}$ ) ..	$\pm 1.75$ A
(Continuous) .....	$\pm 1.5$ A
Logic Supply Voltage, $V_{CC}$ .....	7.0 V
Logic Input Voltage Range, $V_{IN}$ .....	-0.3 V to +7.0 V
Output Emitter Voltage, $V_E$ .....	1.5 V
Package Power Dissipation, $P_D$ .....	See Graph
Operating Temperature Range, $T_A$ .....	$-20^\circ\text{C}$ to $+85^\circ\text{C}$
Storage Temperature Range, $T_S$ .....	$-40^\circ\text{C}$ to $+150^\circ\text{C}$

Output current rating may be limited by duty cycle, ambient temperature, and heat sinking. Under any set of conditions, do not exceed the specified peak current rating or a junction temperature of  $+150^\circ\text{C}$ .

The A2918SWH and A2918SWV motor drivers are designed to drive both windings of a bipolar stepper motor or bidirectionally control two dc motors. All bridges are capable of sustaining 45 V and include internal pulse-width modulation (PWM) control of the output current to 1.5 A.

For PWM current control, the maximum output current is determined by the user's selection of a reference voltage and sensing resistor. A PHASE input to each bridge determines load current direction. Active low ENABLE inputs control the four drivers in each bridge.

The bridges include both ground clamp and flyback diodes for protection against inductive transients. Internally generated delays prevent cross-over currents when switching current direction. Special power-up sequencing is not required. Thermal protection circuitry disables the outputs if the chip temperature exceeds safe operating limits.

The A2918SWH/V are supplied in an 18-lead power-tab package with staggered lead forming. The tab is internally insulated from the device and requires no external isolation. The A2918SWH/V are available for operation from  $-40^\circ\text{C}$  to  $+85^\circ\text{C}$ . To order, change the suffix from 'S-' to 'E-'. These devices are also available on special order for operation to  $+125^\circ\text{C}$ .

### FEATURES

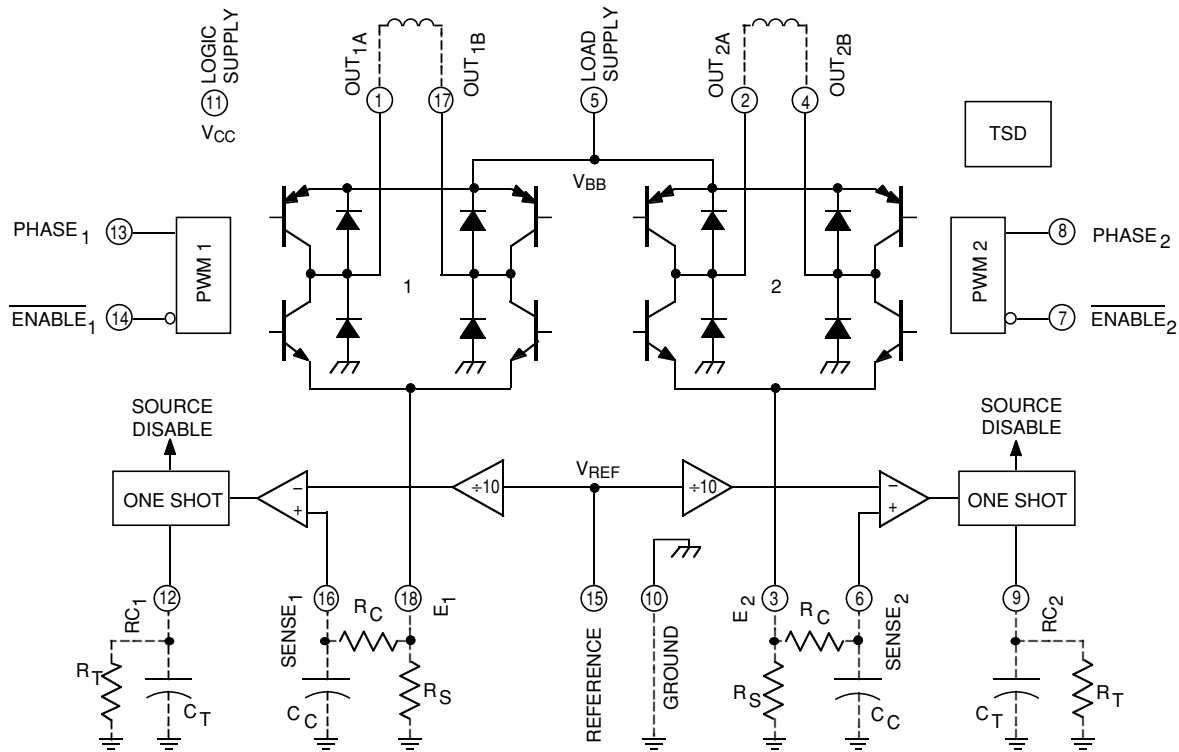

- $\pm 1.5$  A Continuous Output Current
- 45 V Output Sustaining Voltage
- Internal PWM Current Control
- Low Output Saturation Voltage
- Internal Clamp Diodes
- Internal Thermal Shutdown Circuitry
- Similar to Dual PBL3718 or Dual PBL3770

Always order by complete part number:

Part Number	Application
A2918SWH	For Horizontal Mount
A2918SWV	For Vertical Mount

## APPLICATIONS INFORMATION

### PWM Current Control

The A2918SWH/V dual bridges are designed to drive both windings of a bipolar stepper motor. Output current is sensed and controlled independently in each bridge by an external sense resistor ( $R_S$ ), an internal comparator, and an internal monostable multivibrator.

When the bridge is turned ON, current increases in the motor winding and it is sensed by  $R_S$  until the sense voltage ( $V_{SENSE}$ ) reaches the level set at the comparator's input:

$$I_{TRIP} = V_{REF}/10 R_S$$

The comparator then triggers the monostable which turns OFF the source driver of the bridge. The actual load current peak will be slightly higher than the trip point (especially for low-inductance loads) because of internal logic and switching delays. This delay ( $t_d$ ) is 2  $\mu$ s typically. After turn-off, the motor current decays, circulating through the ground clamp diode and sink transistor. The source driver's OFF time  $t_{off}$ , and therefore the magnitude of the current decrease, is determined by the monostable's external RC timing components, where  $t_{off} = R_T C_T$  within the range of 20 k $\Omega$  to 100 k $\Omega$  and 200 pF to 500 pF.

When the source driver is re-enabled, the winding current (the sense voltage) again is allowed to rise to the comparator's threshold. This cycle repeats itself, maintaining the average motor winding current at the desired level.

Special circuitry has been included to prevent runaway current control when  $t_{off}$  is set too short. This circuitry prevents the source driver from being re-enabled until the load current has decayed to below the  $I_{TRIP}$  level.

Loads with high distributed capacitances may result in high turn-ON current peaks. This peak, appearing across  $R_S$ , will attempt to trip the comparator, resulting in possible erroneous current control or high-frequency oscillations. An external  $R_C C_C$  low-pass filter may be used to delay the action of the comparator, and thus ignore turn-on spikes.

## General

To avoid excessive voltage spikes on the LOAD SUPPLY pin ( $V_{BB}$ ), a large-value capacitor ( $\geq 47 \mu\text{F}$ ) should be connected from  $V_{BB}$  to the ground pin as close as possible to the device. Under no circumstances should the voltage at  $V_{BB}$  exceed 45 V.

The PHASE input to each bridge determines the direction motor winding current flows. An internally generated deadtime, of approximately  $3 \mu\text{s}$ , prevents crossover currents that can occur when switching the PHASE input.

All four drivers in the bridge output can be turned OFF, with  $V_{EN} \geq 2.4$ , resulting in a fast current decay through the internal ground clamp and flyback diodes. The fast current decay is desirable in half-step and high-speed applications. The ENABLE input must be tied low if it is not used.

Varying the reference voltage ( $V_{REF}$ ) provides continuous control of the peak load current.

Thermal protection circuitry turns OFF all drivers when the junction temperature reaches approximately  $+170^\circ\text{C}$ . It is intended only to protect the device from failures due to excessive junction temperature and should not imply that output short circuits are permitted. The output drivers are re-enabled when the junction temperature cools to approximately  $+145^\circ\text{C}$ .
