

# **Application Note: SY6280/SY6280A**

5.5V, 2A Low Loss Power Distribution Switch

### **General Description**

SY6280/ SY6280A is ultra-low  $R_{\rm DS(ON)}$  switch with programmable current limit to protect the power source from over current and short circuit conditions. They incorporate over temperature protection and reverse blocking functions. SY6280 automatically discharges the output capacitors during shutdown.

### **Ordering Information**

Temperature Range: -40°C to 85°C

Ordering Number	Package type	Note		
SY6280AAC	SOT23-5			
SY6280AAAC	SOT23-5			

### **Features**

- Input voltage: 2.4V to 5.5V
- 2A load current capability
- Programmable current limit
- Enable polarity: active high
- Over temperature protection
- Reverse blocking (no body diode)
- OUT can be forced higher than IN at shutdown
- Output discharge function
  - ♦ SY6280: Auto output discharge function
  - SY6280A: No output discharge function
- Compact SOT23-5 package minimizes the board space

### **Applications**

- USB 3G Datacard
- USB Dongle
- MiniPCI Accessories

## **Typical Applications**

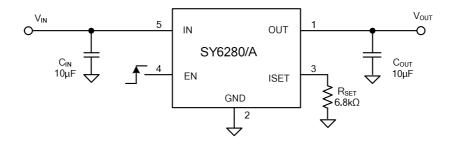

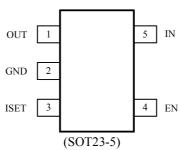

Figure 1. Schematic Diagram(1A current limit)

# Pinout (top view)

Top mark: COxyz for SY6280 (Device code: CO, x=year code, y=week code, z= lot number code)

QWxyz for SY6280A (Device code: QW, x=year code, y=week code, z= lot number code)

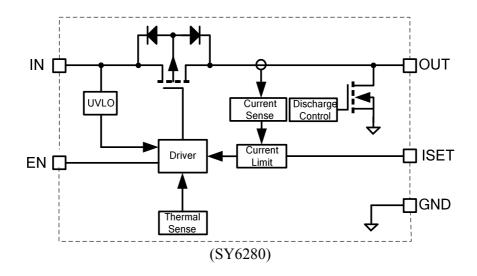

Q Ways for \$1020011 (Bevice code. Q W, x year code, y week code, z tot number code)						
Pin Name	Pin number	Pin Description				
IN	5 Input pin, decoupled with a 10μF capacitor to GND					
GND	GND 2 Ground pin					
OUT	1	Output pin, decoupled with a 10µF capacitor to GND				
EN	4	ON/OFF control. Pull high to enable IC. Do not leave it floating				
ISET	3	Current limit programming pin. Connect a resistor R <sub>SET</sub> from this pin				
		to ground to program the current limit: $I_{LIM}(A)=6800/R_{SET}(\Omega)$				

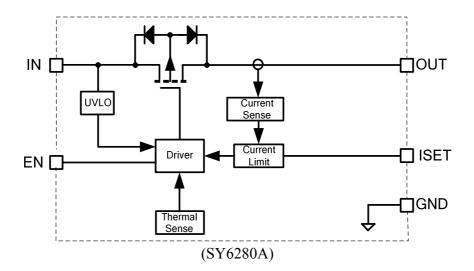

Absolute Maximum Ratings (Note 1)	
All pins	0.3V to 6V
Power Dissipation, PD @ TA = 25°C SOT23-5,	0.6W
Package Thermal Resistance (Note 2)	
heta Ja	200°C/W
heta JC	130°C/W
Junction Temperature	150°C
Lead Temperature (Soldering, 10 sec.)	260°C
Storage Temperature Range	
ESD Susceptibility (Note 2)	
HBM (Human Body Mode)	2kV
MM (Machine Mode)	200V
<b>Recommended Operating Conditions</b> (Note 3)

### **Electrical Characteristics**

 $(V_{IN} = 5V, C_{OUT} = 10\mu F, T_A = 25^{\circ}C$  unless otherwise specified)

Parameter	Symbol	Test Conditions	Min	Тур	Max	Unit
Input Voltage Range	V <sub>IN</sub>		2.4		5.5	V
Shutdown Input Current	I <sub>SHDN</sub>	Open load, IC Disabled.		0.2	1	μΑ
Quiescent Supply Current	$I_Q$	Open load, IC Enabled.		38		μA
FET RON	R <sub>DS(ON)</sub>			63		mΩ
EN Rising Threshold	$V_{EN(H)}$		2			V
EN Falling Threshold	$V_{EN(L)}$				0.8	V
EN Leakage Current	$I_{EN}$	$V_{EN}=5.0V$			1	μΑ
IN UVLO Threshold	$V_{IN\_UVLO}$				2.3	V
IN UVLO Hysteresis	$V_{IN\_HYS}$			0.1		V
Over Current Limit	$I_{LIM}$	$R_{SET}=6.8k\Omega$	0.75	1	1.25	Α
	$I_{LIM(min)}$			0.4		Α
Turn-on Time	$T_{ON}$	$R_L=10\Omega$ , $C_{OUT}=1\mu F$		130		μs
Turn-off Time	$T_{OFF}$	$R_L=10\Omega$ , $C_{OUT}=1\mu F$		20		μs
OUT Shutdown Discharge Resistance	$R_{DIS}$	SY6280 Only		120		Ω
Thermal Shutdown Temperature	$T_{SD}$			130		$^{\circ}$ C
Thermal Shutdown Hysteresis				20		$^{\circ}$ C

**Note 1**: Stresses beyond the "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only. Functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

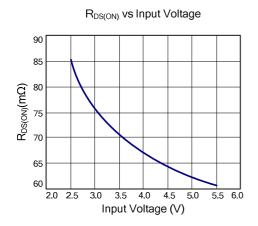

**Note 2**:  $\theta_{JA}$  is measured in the natural convection at  $T_A$  = 25°C on a low effective single layer thermal conductivity test board of JEDEC 51-3 thermal measurement standard. Pin 2 of SOT23-5 packages is the case position for  $\theta_{JC}$  measurement.

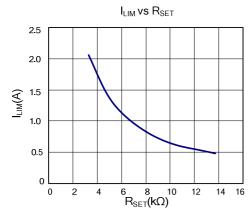

Note 3: The device is not guaranteed to function outside its operating conditions.

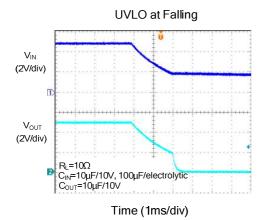

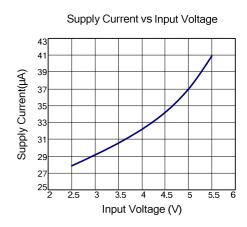

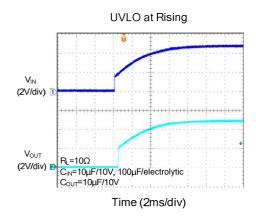

### **Typical Operating Characteristics**

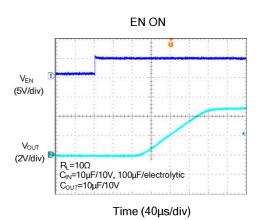

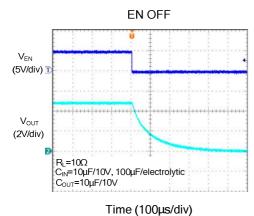

### **Operation**

SY6280/A is a current limited P-channel MOSFET power switch with over current and over temperature protections. There is no body diode across the drain and the source of the MOSFET. It prevents the current flow from the output to the input after the chip is disabled.

#### **Over-current protection**

When the over-current condition is detected, the switch is regulated to achieve constant output current. If the over current condition lasts for a long time, and results in a junction temperature over 130°C, the switch will be shutdown. Once the junction temperature drops to 110°C, the part will restart.

#### **Supply Filter Capacitor**

In order to prevent the input voltage from dropping during hot-plug condition, a  $10\mu F$  ceramic capacitor from VIN to GND is strongly recommended. However, higher capacitance could help reduce the voltage drop. Furthermore, an output short will cause ringing on the input without the input capacitor. It could destroy the internal circuitry when the input transient voltage exceeds the absolute maximum supply voltage even for a short duration.

#### **Current Limiting Setting**

Current limit is programmable to protect the power source from over current and short circuit conditions. Connect a resistor  $R_{SET}$  from ISET pin to GND to program the current limit:

$$I_{LIM}(A) = 6800 / Rset(\Omega)$$
.

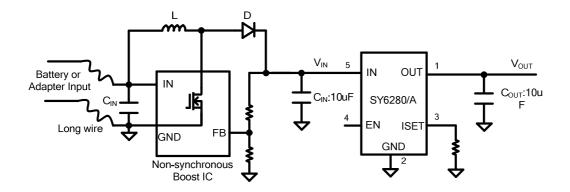

The minimum current limit is 0.4A. Current limit beyond 2A is not recommended.

#### **Maximum input voltage consideration:**

For any application, input voltage for SY6280/A should not be allowed to exceed the maximum recommended value (5.5V).

Below is a typical application circuit for SY6280/A. The front stage is a non-synchronous boost stage and the input power supply can be a battery or an adapter.

Some adapters may have poor output voltage tolerance, or may have large output voltage overshoot if the adapter is hot plug in directly. The voltage overshoot higher than VIN( 5.5V) will significantly reduce the reliability of SY6280/A and may even lead to IC EOS failure.

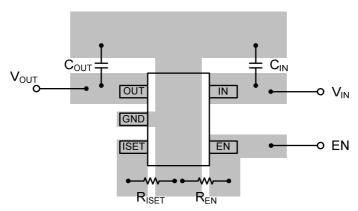

### **PCB Layout Guide**

To achieve a better performance, the following guidelines must be strictly followed:

- **>** Keep all power traces as short and wide as possible and use at least 2 ounce copper for all power traces.
- ➤ Place a ground plane under all circuitry to lower both resistance and inductance and improve DC and transient performance.
- Locate the output capacitors as close to the connectors as possible to lower the impedance (mainly inductance) between the port and the capacitor and improve transient performance.
- ➤ Input and output capacitors should be placed close to the IC and connected to the ground plane to reduce noise coupling.
- ▶ Locate the ceramic bypass capacitors as close as possible to the IN pin and OUT pin of SY6280/A.
