## FUNCTIONAL DESCRIPTION

The CM8562B is a linear regulator that is capable of sinking and sourcing 1.8A of current without an external heat sink.

The CM8562B integrates power MOSFETs that are capable of source and sink 1.8A of current while maintaining excellent voltage regulation. The output voltage can be regulated within 3% or less by using the external feedback. Separate voltage supply inputs have been added to fit applications with various power supplies for the databus and power buses.

### OUTPUTS

The output voltage pins (VOUT) are tied to the databus, address, or clock lines via an external inductor. Output voltage is determined by the VIN.

### INPUTS

The input voltage pins (VIN) determine the output voltages (VOUT). At CM8562B, the desired output voltage could be programmable by two external voltage divider resistors. VIN is suggested to connect to VDDQ of memory module for better tracking with memory VDDQ.

### OTHER SUPPLY VOLTAGES

VCCA provide the voltage supply to the logic section and internal error amplifiers of CM8562B.
